## GUIDANCE FOR THE USE OF THIS CAMPSITE INVENTORY

1. This campsite capacity determination is the composite result of an intensive physical campsite inventory combined with actual observations of public use during the field seasons 2015-2017.
2. This compilation is a component of a physical and social assessment process of the descriptive “carrying capacity” for the campsite function of the wild section of the Rogue Wild and Scenic River, as required by the 1968 Wild and Scenic Rivers Act (P.L 90-542)
3. Data for the flow range (cubic feet per second; CFS) was measured at the USGS river gauge located at Grants Pass, OR. The range approximates the median mean hourly flow during the regulated use period from May 15 to October 15 and post construction of Lost Creek Dam on the upper Rogue in 1978.
4. Geographic location is described in Universal Transverse Mercator (UTM) Zone 10, NAD 83. Latitude and Longitude descriptions are located in tabular form in the appendix.
5. Campsite names shown in this inventory are derived from a number of sources, including public and privately produced river guidebooks, historic names used internally by the BLM and USFS, as well as the professional discretion of the agency river rangers who completed the intensive inventory phase of this study.
6. This inventory report was designed to be re-evaluated on an annual basis to reflect changes resulting from winter high water flows.
7. This inventory could not have been completed without BLM and USFS staff support, including the dedicated effort of our field crew; Jacob Risley, Kerry Cushing, and Joe Vaninetti. Jim Reed, PhD. volunteered to assist with map production. **THANK YOU.**
